A. Consecutive k-out-of-n failed system with independent component failures The linear consecutive k-out-of-n failed system [11], commonly abbreviated to consecutive k-out-of-n:F is a system with n components in series. As the name suggests, such a system fails if and only if k consecutive components fail.

A cyclic consecutive-k-out-of-n: G system consists of n components lying on a cycle. Those components are exchangeable bur may have different working probabilities. The system works if and only if there are k consecutive components at work. What is the optimal assignment of components for maximizing the reliability of the system?
